

## **C3iVAZRA**

A surveillance system installed at the National Highways Authority of India headquarters at Dwarka keeps track of the health of all the computers in its network, flagging attempts to hack into the system, malware in systems within the network, or malfunctioning programme being used.

Installed in 2021, the Security Operation Center (SoC) titled C3iVazra has protected the computers that monitor the highways across the country and has alerted about potential dangers. C3iVazra provides supervisory monitoring by gathering the real-time event, and log feeds from the endpoints, packet data from the network and the internet, and processes these feeds to generate threat intelligence and ensure network security of the organization. Major benefits of this solution are increased efficiency in incident response, reduced impact of security breaches, better reporting and notification, log analysis, and retention.
